Storm water is not cleaned before it empties into our waterways. This means that lawn care chemicals and grass clippings, litter, pet wastes, automotive products like used oil and antifreeze, plus other wastes are dumped untreated, into our waterways. Pollution and harmful bacteria go straight into our local fish habitat, swimming areas and drinking water.

There are things we can do to help! Individuals or groups can volunteer to place markers along our streets to remind everyone not to dump things down the storm drains.

Do you want your students or group members to get more out of storm drain marking...schedule a FREE CONSERVATION EDUCATION PROGRAM:

Creek Critter Clues—Find out how tiny macroinvertebrates in our local streams and rivers give clues to the water's health in this in-the-classroom **Introduction to Stream Watch**, Trumbull County's stream quality monitoring program. No field trip is required for this session.

Where Does Your Water Shed? - Did you know Trumbull County has 3 main watersheds?

This program utilizes a table-top watershed model called the *Enviroscape* to demonstrate the concept of watersheds as well as potential sources of pollution.

Stream Watch - Go WILD as we collect BUGS to determine the health of our local streams. Field collection, sorting, identifying and recording of biological & chemical data make this an unforgettable outdoor laboratory experience. Do you have a stream on-site at your school or close by? Let's plan a great local field trip!

Healthy Water, Healthy People—Find out how water quality has impacted history and how you can our local waterways from becoming contaminated and keep our population healthy. Classroom activities are taken from the *Healthy Water, Healthy People* curriculum guide, a Project WET related curriculum. Please note: there are a number of *Healthy Water, Healthy People* activities that focus on chemistry and biology.

Have an idea for a water quality program?
We can customize a program for your class!
